

1.1. $W = 2 \times 2$; $X = 3 \times 3$;

$$\begin{bmatrix} w_{00} & w_{01} \\ w_{10} & w_{11} \end{bmatrix} * \begin{bmatrix} 0 & 0 & 0 & 0 & 0 \\ 0 & x_{00} & x_{01} & x_{02} & 0 \\ 0 & x_{10} & x_{11} & x_{12} & 0 \\ 0 & x_{20} & x_{21} & x_{22} & 0 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix} = \begin{bmatrix} w_{11} x_{00} & w_{10} x_{02} \\ w_{01} x_{20} & x_{22} w_{00} \end{bmatrix}$$

Flattening X gives a 9×1 array, $\Rightarrow A$ should be a 4×9 array.

$$A = \begin{bmatrix} w_{11} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & w_{10} & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & w_{01} & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & w_{00} \end{bmatrix} \quad \begin{bmatrix} x_{00} \\ x_{01} \\ x_{02} \\ x_{10} \\ x_{11} \\ x_{12} \\ x_{20} \\ x_{21} \\ x_{22} \end{bmatrix}$$

$$= \begin{bmatrix} w_{11} x_{00} \\ w_{10} x_{02} \\ w_{01} x_{20} \\ w_{00} x_{22} \end{bmatrix} \leftarrow \text{flattened } Y.$$

1.2. $W = \begin{bmatrix} w_{00} & w_{01} \\ w_{10} & w_{11} \end{bmatrix}$ $X = \begin{bmatrix} x_{00} & x_{01} \\ x_{10} & x_{11} \end{bmatrix}$.

transpose conv with 2 stride is

Flattened $\lambda = [x_{00} \ x_{01} \ x_{10} \ x_{11}]^T$.

$$\begin{bmatrix} w_{00} X & w_{01} X \\ w_{10} X & w_{11} X \end{bmatrix}$$

each x is 2×2 .

Flattened $Y = 16 \times 1$ array.

So, we get a 4×4 matrix.

$\therefore A = 4 \times 16$ array.

~~Matrix~~

$A =$

$$\begin{bmatrix} w_{00} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ w_{01} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ w_{10} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ w_{11} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & w_{00} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & w_{10} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & w_{01} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & w_{11} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & w_{00} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & w_{10} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & w_{01} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & w_{11} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & w_{00} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & w_{10} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & w_{01} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & w_{11} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & w_{00} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & w_{10} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & w_{01} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & w_{11} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

13. Given $X = \begin{bmatrix} x_{00} & x_{01} \\ x_{10} & x_{11} \end{bmatrix}$ Consider conv filter

$$\text{Output of conv (stride=1, pad=0)} = \begin{bmatrix} w_0 & w_1 \\ w_2 & w_3 \end{bmatrix}$$

layer $i = \begin{bmatrix} w_i x_{00} & w_i x_{01} \\ w_i x_{10} & w_i x_{11} \end{bmatrix} = w_i X.$ $\rightarrow 4 \times 1 \times 1 \times 1.$

Let transpose conv filter = $\begin{bmatrix} w_0 & w_1 \\ w_2 & w_3 \end{bmatrix}.$

transpose output (stride=2, pad=0)

$$= \begin{bmatrix} w_0 X & w_1 X \\ w_2 X & w_3 X \end{bmatrix}, \text{ each } X = 2 \times 2 \text{ mat}$$

$\Rightarrow \text{output} = 4 \times 4 \text{ mat.}$

See that 4 conv layers can be placed next to each other to become output of transpose conv.

$$= \begin{bmatrix} \text{conv-out}[0] & \text{conv-out}[1] \\ \text{conv-out}[2] & \text{conv-out}[3] \end{bmatrix}$$

Hence we can prove the property.

2.1. $w_{And} = [1, 1]$. $b_{And} = -1.5$

3.1 Given $x=1$.

$$\max(0, w_1 x + b_1) = w_1 x + b_1 = h_1$$

$$\max(0, w_2 h_1 + b_2) = w_2 h_1 + b_2 = h_2$$

$$\max(0, w_3 h_2 + b_3) = w_3 h_2 + b_3 = h(x).$$

Calculating, we get.

$$h(x) = 2x + 3.$$

$$\boxed{\frac{\partial h}{\partial x} = 2.}$$

3.2 . Given $x = -1$.

$$\max(0, w_1 x + b_1) = \begin{bmatrix} 0.5 \\ 0.5 \end{bmatrix} (-1) + \begin{bmatrix} 0 \\ 1 \end{bmatrix} = \begin{bmatrix} -0.5 \\ 0.5 \end{bmatrix}$$

$$\max(0, \begin{bmatrix} -0.5 \\ 0.5 \end{bmatrix}) = \begin{bmatrix} 0 \\ 0.5 \end{bmatrix}.$$

So, w_1 can be rewritten as $\begin{bmatrix} 0 \\ 0.5 \end{bmatrix}$

~~However~~ However, rest of the weights won't change as all the outputs are > 0 .

Finally $h(x) = x + 3$.

$$\boxed{\frac{\partial h}{\partial x} = 1.}$$

3.3. Given $x = -0.5$

$$w_1x + b_1 = \begin{bmatrix} 0.5 \\ 0.5 \end{bmatrix} (-0.5) + \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$

$$= \begin{bmatrix} -0.25 \\ 0.75 \end{bmatrix}.$$

$$\max(w_1x + b_1)_0 = \begin{bmatrix} 0 \\ 0.75 \end{bmatrix}.$$

$\therefore w_1$ can be rewritten as $\begin{bmatrix} 0 \\ 0.5 \end{bmatrix}$.

Rest of w_2, w_3 & b 's won't be affected as
all outputs are > 0 .

Asking, we set $h(x) = x + 3$.

$$\boxed{\frac{\partial h}{\partial x} = 1.}$$

$$4.1 \quad f_1(x) = |w^T x + b|$$

$$= \begin{bmatrix} 12x_1 - 11 \\ 12x_2 - 11 \\ \vdots \\ 12x_d - 11 \end{bmatrix} \rightarrow d \text{ dim vector.}$$

Take a particular coordinate, say 1.

$12x_1 - 11$ can map to $[0, 1]$ when $x \in [0, 1/4]$ & $[1/2, 1]$

\therefore Each coordinate has 2 ways.

d coordinates have $\underbrace{2 \times 2 \dots \times 2}_d$ ways.

\therefore 2^d input regions are identified onto 0

4. 2. Given $f(g(x))$. Let $g(x) = h$.

$f(h) \in [0, 1]^d \Rightarrow h$ can be any of n_f regions

$h = g(x)$. Each h can be any of n_g regions

\Rightarrow $f(g(x))$ identifies $n_f \times n_g$ regions.

4.3. Using 4.1 & 4.2,

$h_L = |w_L h_{L-1} + b_L| \Rightarrow h_{L-1}$ can be any of 2^d regions.

For each, $h_{L-1} = |w_{L-1} h_{L-2} + b_{L-1}| \Rightarrow h_{L-2}$ can be any of 2^d regions.

\Rightarrow total regions $\Rightarrow 2^d \times 2^d$.

When we go till $h_1 = |w_1 x + b_1|$,

we similarly get any of $\underbrace{2^d \times 2^d \dots \times 2^d}_L = 2^{Ld}$

regions of x can be mapped to each region of $f(x) = h_L$.

$$2.2 \quad w_{or} = [1, 1] \quad b_{or} = -0.5.$$

2.3. let $w = [w_1, w_2]$ $b = b.$

As per eqns. $0 \cdot w_1 + 0 \cdot w_2 + b < 0$ — (1)

$$0 \cdot w_1 + 1 \cdot w_2 + b \geq 0 \text{ — (2)}$$

$$1 \cdot w_1 + 0 \cdot w_2 + b \geq 0 \text{ — (3)}$$

$$1 \cdot w_1 + 1 \cdot w_2 + b < 0 \text{ — (4)}$$

$$1 + 4 \Rightarrow 1 \cdot w_1 + 1 \cdot w_2 + 2b < 0$$

$$2 + 3 \Rightarrow 1 \cdot w_1 + 1 \cdot w_2 + 2b \geq 0$$

These 2 eqns are contradictory. Hence no such set of w, b exists.
